With this doc understand the major SQL concepts and ace your next interview.

01 QUESTION

How do you find the last ID in a SQL table?

In SQL, you can find the last ID in a table using the MAX function along with the column that represents the ID. Assuming you have an "id" column in your table, you can use the following query:

```SQL
SELECT MAX(id) AS last_id FROM your_table_name;
```

This query selects the maximum (largest) value in the "id" column and aliases it as "last_id." The result will be a single row with the highest ID value in the specified table.

Otherwise, in many SQL versions, we can use the following syntax:

```SQL
SELECT id
FROM your_table_name
ORDER BY id DESC
LIMIT 1;
```

This query selects the maximum (largest) value in the "id" column and aliases it as "last_id." The result will be a single row with the highest ID value in the specified table.
